

Scientific American.

ESTABLISHED 1845.

MUNN & CO., Editors and Proprietors.

PUBLISHED WEEKLY AT NO. 37 PARK ROW, NEW YORK.

O. D. MUNN. A. E. BEACH.

TERMS FOR THE SCIENTIFIC AMERICAN.

One copy, one year, postage included. \$3 20 One copy, six months, postage included 1 60 Clubs.—One extra copy of THE SCIENTIFIC AMERICAN will be supplied gratis for every club of five subscribers at \$3.20 each; additional copies at same proportionate rate. Postage prepaid.

Scientific American Export Edition.

The SCIENTIFIC AMERICAN Export Edition is a large and splendid periodical, issued once a month. Each number contains about one hundred large quarto pages, profusely illustrated, embracing: (1.) Most of the plates and pages of the four preceding weekly issues of the SCIENTIFIC AMERICAN, with its splendid engravings and valuable information; (2.) Commercial, trade, and manufacturing announcements of leading houses. Terms for Export Edition, \$5.00 a year, sent prepaid to any part of the world. Single copies 50 cents. Manufacturers and others who desire to secure foreign trade, may have large and handsomely displayed announcements published in this edition at a very moderate cost.

The SCIENTIFIC AMERICAN Export Edition has a large guaranteed circulation in all commercial places throughout the world. Address MUNN & CO., 37 Park Row, New York.

VOL. XXXVIII, No. 21. [NEW SERIES.] Thirty-third Year.

NEW YORK, SATURDAY, MAY 25, 1878.

Contents.

(Illustrated articles are marked with an asterisk.)

Table listing various articles such as Amber, artificial; Astronomical notes; Bats, exterminating; Blast, heavy; Bleaching preparation; Book notices; Bridge, proposed Thames; Business and personal; Butter, natural from artificial; Cement, metal and leather; Communications received; Correspondence; Counterfeit trade dollars; Custard and cholera; Electric light; Electro-magnet, large; Engraving; Feed water; Franklin, Sir John; Galvanic battery; Gas, cheap; Gate, Cooksey's improved; Glacial movement; Gold coins, cleaning; Injections; Linocopying; Irradiation; Lamp, nursery; Lead, clarifying; Locomotive headlight; Machinery vs. hand labor; Marking fluid; Mercury, treatment of; Metric system; Mill, Phillips' grinding; Minerals; Napkin rest; Patents, necessities; Notes and queries; Old Colony accident; Organ, great Cincinnati; Ozonite; Patents, English to Americans; Patent law discussion; Patents, official list of; Patterns and patent rights; Pencils, charcoal; Plumbing and sewer gas; Regnaud, Victor; Rivers, power of; Salt river; Scientific Am., export edition; Serpents' fangs; Silk deception; Similan visitors; Sirius, companion of; Soap for permanent bubbles; Southern enterprise; Spirit hands and morbid minds; Steam pressure regulator; Telegraph, Norwegian factory; Thymol; Ticinese; Walking on water; Water, impure; Wax, taste of; Wax, modeling; Wick regulator; Yarn, novelty in.

TABLE OF CONTENTS OF THE SCIENTIFIC AMERICAN SUPPLEMENT No. 125.

For the Week ending May 25, 1878.

Price 10 cents. To be had at this office and of all newswriters.

I. ENGINEERING AND MECHANICS.—Dust as an Explosive. How Combustible Substances may Explode. Spontaneous Combustion of Iron in Air. Phosphorus. Flour Dust. Dust in Breweries. Spontaneous Combustion of Charcoal and Lampblack. Explosions of Coal Dust in Mines. A comprehensive statement of the dangers from Emery in various manufactures, and how many fires occur.—The American Patent System. Iron Railway Ties and Sleepers. By CHARLES WOOD. The various systems of Iron Sleepers. The Bowl, Pot, or Oval Sleeper. The Longitudinal Wrought Iron Sleeper. The Wrought Iron Transverse Sleeper. Practical experience with each class, etc. Durability of Wrought Iron for Sleepers. How to utilize old Sleepers. Adjustment of Ganges on Curves. Spreading out. The Barlow combined Sleeper and Rail. Hill's, Hoenecker's, and Thommen's systems. Serre's and Battig's system. McLeilan's and Potel's Sleepers. Wood's cross system. The several systems illustrated with 12 figures, and all particulars given of Balasting, Spikes, Keys, Chairs, Collars, etc. Labor, First Cost, Cost of Maintenance, Wear, Corrosion, etc. Railway Appliances at the Philadelphia Exhibition. Paper read before the Institution of Civil Engineers, London, by DOUGLAS GALTON. F. R. S. Characteristic differences between American and European Railways. The Wharton switch. The use of chilled Cast Iron Wheels. Axles. The Miller Coupling and Buffer. Brakes. Stoves. Locomotives in America and in Europe.—Improved Rail Joint. 2 illustrations. Emery and Corundum Wheels for Grinding and Surfacing Metals and other materials. By ARTHUR H. BARKMAN, F. C. S. Read before the Society of Arts. Files, Chisels, Gouges, and other tools. Quality, specific gravity, and hardness. Manufacture of Emery Wheels. Sorting, Crushing, Sifting, Washing Over, etc. Emery Powder, Buffing, Polishing, Cutting Power. Corundum. The Magnesian or Union Emery Wheel, and others. Fifty uses enumerated to which the Wheels are put, for Metal, Stone, Teeth, Millboard, Wood, Agate, and Bricks. How to mount a Wheel. How to hold the work, and directions for various classes of materials. Discussion and questions. The Blair Process. Recent Improvements in the Manufacture of Iron Sponges by the Blair Process. By J. IRELAND. Paper read before the Iron and Steel Institute.—Improved Spiral Punch. 3 illustrations.—The Invention of the Reaping Machine.—Corrosion of Iron and steel.—The French Exposition. The Voruz Railway Car Derrick. Description, with 1 engraving. II. TECHNOLOGY.—The Waste of Gaslight. How one quarter of all gas used might be saved. Relative light-absorbing power of Dark and Light Walls, Closets, and how much Light they Waste. Coronets, Gaslight, Waste from a Sanitary Point.—The Merchant Fleets of the World. Paint in Construction. By ROBERT GRIMSHAW.—Lime, Paris White, White Lead, Zinc White, Baryta White, Blende, Antimony White, Iron Oxide, Red Lead, Prussian Blue, Cobalt Blue, Smalt, Coal Tar, Soluble Glass, Yellow Ochre, Raw Sienna, Fuller's Earth, Lampblack.—Black Stains for Wood. Logwood.—Treatment of Venereal.—Special Treatment for Oak. Treatment with Aniline Black.—Cleaning Oil Paintings.—Restoration of Writing.—Kallab's Bleaching Process.—Alberrite.—The Chains of Egypt. III. ELECTRICITY, LIGHT, HEAT, ETC.—A Lunar Landscape.—Varley's Magneto-Electric Machine. 3 illustrations. IV. MEDICINE AND HYGIENE.—The Art of Preserving the Eyesight. From the French of Arthur Cleraller. No. I. The Anatomy of the Eye. The Socket; the Muscles; the Inner Surface of Eyelids. The Tear Apparatus; the Rods and Cones; Coats of the Eye; Sections of the Retina; Optic Nerves; the Humors. An exceedingly plain and concise description of the Anatomy throughout, with 9 engravings. The Treatment of Diphtheria. By LOUIS ZEIGERT, M. D. Details of Remarkably Successful Treatment. A Case of Hydrophobia. By CHARLES C. PIKE, M. D. Symptoms, Treatment, Death, and Autopsy. Conclusions. Alcoholism, Intemperance, and Insurance. The New York Mutual Life Insurance Company. Average Risks of the Temperate and of the Intemperate. The Average Expectancy of Life. Statistics of Disease. The Physiological Action of Alcohol Stimulating Action. Alcohol Retarding the Circulation. Alcohol Oxidized in the System. Insomnia, Congestion of the Lungs, and Deteriorations of Structure as effects of Alcohol. Calculus and Liver Disease, as results of Drink. Universal Medical Testimony against Alcohol.—Speech for the Dumb. Past Wrongs and Sufferings of the Dumb. The German Method of Teaching Articulation. The French System. Professor A. Graham Bell's Lecture, The Vocal Organs of the Dumb not Defective. The Sign System; Lip-reading.—The Founder of Modern Histology. V. AGRICULTURE, HORTICULTURE, ETC.—Value of Hen Manure.—White and Yellow Corn. VI. CHESS RECORD.—Biographical sketch and Portrait of Samuel Rosenthal, of Paris, with one of his Blindfold Games.—Problem by Samuel Loyd.—Initial Problem by Eugene B. Cooke.—Frank Leslie's Problem Tournament of 55. Enigma by Samuel Loyd. Enigma by T. M. Brown.—Problem by Isaac S. Loyd.—Solutions to Problems.

THE BLACK SILK DECEPTION.

It is a matter of fact too well known to require any demonstration that the quantity of black silk used for wearing apparel far exceeds the amount of colored silk similarly employed. It may perhaps be said that there is no fabric made which finds a more extensive utilization than does black silk, and certainly there is none with which every retailer of drygoods and every experienced fair shopper thinks he or she is more familiar. The seller is always quite willing to affirm that his silk will "wear like a board," although his neighbor's, he insinuates, probably will not, and he is equally ready to advance the mooted questions of cachemire or "satin finish," or "soft" or "stiff" silk, just in accordance with the views of the customer being served. The latter has her own predilections in favor of "yellow edge" or "white edge," distinctions for which we never could trace any reason, as different manufacturers do not seem to confine themselves to particular colored edges as indicative of degrees of excellence; and she further knows that silks are apt, 1st, to crack wherever folded; 2d, to pull, so that where once was a smooth fit wrinkles appear, which on nearer inspection are found to be due to the opening of the threads; and, 3d, to become "shiny," or rather to assume a greasy appearance at all prominent portions where the fabric is rubbed.

There also exists among purchasers an undefined knowledge that black silk is weighted in the dyeing, that is, that the dye makes it heavier. Dealers generally admit this in a matter-of-course way, and the buyer is led to believe that the treatment which the silk undergoes is a quite necessary industrial process incident to its manufacture; and that it in no wise reduces wear, makes the silk richer, etc. It is true enough that all dye must render the fabric more weighty; and the average purchaser does not trouble herself, so long as the silk is fine appearing and cheap, to question how much of it is owing to the art of the dyer and how much of it to the silkworm.

More interest, however, might be and perhaps will be taken when it is known that there is now no such thing as a good black silk in the market; and that the black silks now sold in this country, whether domestic or foreign, are such grossly adulterated fabrics as to amount to impositions and swindles of the most reprehensible character. In justice to most retail dealers it should be said that they are the victims of the manufacturers' deceptions, and should, therefore, be classed with the public at large; but there are many firms who have their silks expressly made and expressly weighted according to their orders, and they sell over their counters, as silk, stuff which contains less silk than it does adulterant.

We have frequently stated the fact that by no means all the ingenuity in the world is enlisted on the side of rectitude, but that a very goodly share is devoted to nefarious ends. Progress follows experience regardless of the end in view, and this silk iniquity is an excellent example of the fact. Mr. Lewis Leigh, of Pittsfield, Mass. (a well known silk dyeing expert, to whom we are indebted for the facts in this article), has exhibited to us samples of silk from which he has removed all the dye, and has weighed the resulting pure silk fabric, the result showing, in many cases, that the dye exceeds 150 per cent, and in some reaches 400 per cent, as compared with the quantity of silk. It would astonish some of our fair readers vastly to compare with the original fabric the wretchedly thin webs to which fine, lustrous, thick silk becomes reduced after treatment. They might well wonder not merely how some silks wear, but how they even hang together, for the dye does not add a particle of strength, any more than does the paint on an oilcloth, to which it bears some analogy. The weighting of the silk is not done, as some suppose, by dyeing the finished fabric. In fact, the silk after leaving the loom, beyond simple brushing, undergoes no further treatment. The dyeing processes are carried out on the thrown silk thread, which after boiling receives a large quantity of nitrate of iron in solution. It is then treated with soap and alkali to "kill" the iron, or rather the acid effects of the salt. Another bath of nitrate solution follows, and then another application of soap, and thus these processes are repeated according to the weight desired. The operation is one of building up. When honest silks were made a single process or so of this kind answered all the purpose; but vicious ingenuity discovered that by repeating the operation the thread would be made heavier, and the more numerous the repetitions the greater the weight added.

Bluing by prussiate of potash, which is the next process, is followed by baths of gambier, catch, or other astringents fastened with tin salts. The fabric after passing through this liquor is cleaned and treated with acetate of iron. Then another gambier bath, and as this stage of the operation also adds weight there is a chance for more repetitions. This, however, is virtually a tanning process through the action of the astringent on the gelatine of the silk, and the result is pretty much the same as that of tan on leather. The fabric is now a heavy, dirty, dull looking stuff. To brighten it it is put in a logwood dye bath, with large quantities of soap, often as much as 8 ounces to the pound. The soap is retained in considerable quantities in the silk, and with the alkali already in the material forms a kind of grease which friction and wear speedily bring to the surface. This is the secret of "shininess" and the wearing smooth of black silks of all grades.

So far the swindling process is the same for all varieties of silks. Now, however, the dyer's art extends to finishing the thread so that the completed fabric shall be soft and satin like, or "scroopy," as the peculiar rustling quality

which a stiff silk possesses is technically termed. For the first the thread is sometimes treated with oil and soda; for the second, a little acid goes in. Ladies who think that soft silks and stiff silks possess materially different qualities will thus perceive that there is really no ground for difference at all. After the thread is treated as above described it is wound and woven, and the fabric goes to the market.

It may be asked whether all black silks are thus adulterated. We are positively informed that such is the case. The normal condition of honest black silk is about 17 per cent of dye. Twenty-five years ago the highest percentage reached was 33, but then in the interval dyers have grown wiser.

We have shown the cause of "shininess." Cracking at folds is in the same way due to the extra weight. Just as an oilcloth cracks and breaks when folded at a sharp angle, so does silk, and that the threads pull apart is not at all to be wondered at when the miserable, thin little fabric which bears all the weight of dye is regarded. Colored silks, probably in some measure owing to the smaller demand for them and in great degree to the difficulty of concealing the swindle under various hues, are rarely adulterated. Browns, drabs, slates, and similar shades contain, as a general rule, about 25 per cent weighting, which is not objectionable, but rather gives fullness to the goods. It is generally obtained from a sumac bath. Silks dyed with the anilines being specially bright and highly colored are not weighted, as the addition of the necessary materials to this end tends to obscure the delicacy and brilliancy of the hue.

In order to exhibit the exact weighting of the black silk now sold in New York drygoods stores, we have collected from the six leading houses below named twenty-eight samples of silks of low, medium, and best qualities, as indicated by the price per yard. These, provided with identification marks which gave no clue to their maker's or seller's names, were sent to Mr. Leigh, with instructions to remove the dye, and send us the weights of the pieces before and after the process. In returning them, he states that the general quality of all is good, and that that of Nos. 1, 10, 13, 7, 8, and 17 is especially excellent.

TABLE SHOWING WEIGHTING OF BLACK SILK.

Table with 5 columns: No., Where obtained, Price per yard, Manufacturer, Relative per cent dye, Weight of sample before removal of dye. Rows include A. T. Stewart & Co., Arnold, Constable & Co., J. & C. Johnston, Lord & Taylor, James McCreery & Co., and Boutillier Bros.

No. 22 Mr. Leigh states to be mainly made of waste, and to be of such poor quality that it can easily be sold at a low price without adulteration. Hence the low percentage of dye. Omitting this sample and comparing averages of the others, the following relative percentages of weighting are found:

Table showing percentages of weighting: Silks retailing at and over \$3 per yard... 55 + per cent; under \$3 and at and above \$2... 74; under \$2 and at and over \$1... 94. Average all grades... 74 + per cent.

From this it is evident that the lower the price the greater the weighting. Thus, when silk is bought at a dollar a yard, about fifty cents is paid for dye and fifty cents for silk; when purchased at \$3 per yard, \$2 goes for silk and \$1 for dye. Supposing a dress pattern of 20 yards of \$1 silk be purchased, then, one half of this being wasted in dye, the wearing value of the silk is represented by \$10, or half the amount paid. The same amount of \$3 silk costs \$60, and its wearing value would be \$40. But there is four times as much silk in the \$3 fabric as in the \$1 goods; hence \$40 must be divided by 4, which gives 10 as the wearing value. So that it would seem that the person who buys a \$1 silk really gets as much for his money as the buyer of the \$3 silk, assuming that the resistance to wear is directly proportional to the quantity of silk present. In fact, however, the discrimination is largely against the buyer of the \$1 silk, which is relatively of poorer material, besides being overloaded with a greater percentage of weight. So that in this, as in most all other cases where adulterations are brought to light, the cheaper goods are the most falsified, and, of course, the poorer people who are obliged to purchase these materials are the greatest sufferers.

POWER OF RIVERS.—According to Dr. Young, water moving with a velocity of 900 feet per hour tears up fine clay; 1,800 feet carries fine sand; 3,600 feet, fine gravel; 2 miles an hour, moves pebbles as large as a hen's egg. Mr. Logan believes that when a river has the proper load of sediment it loses in abrading power.
